Ai Prompting

Chosen tasks:

- Create assessment questions aligned to learning objectives
- Write a rubric for a project or performance-based assessment
- Suggest engaging learning activities for a specific topic and audience

Initial prompt Questions

- Is the output actually useful, or is it too generic?
- Is it appropriate for your specific audience and context?
- Is anything missing, inaccurate, or off-target?
- Would you be able to use this output in a real project, or would it need significant revision?

Revised prompt Questions

- What specific changes in your prompt produced the most noticeable improvements?
- What surprised you about how the AI responded to your prompts?
- What did you have to contribute as the human expert that the AI could not provide on its own?
- What will you do differently when prompting AI in your future design work?

Task 1: Create assessment questions aligned to learning objectives

First prompt: “Create assessment questions aligned with the learning objective of successful user interviews.”

What worked and what didn't:

I have a good amount of experience with AI prompting, so I wanted to see how much those skills I know, as well as the additional tips and tricks I learned today, truly make a difference

in the output given. I challenged myself by not doing my instinct of being more specific and just gave it the simplest first thought of what I wanted.

The output was pretty generic and not for the audience I need as it gave basic intuitive questions like what is an open-ended question. It seemed to be catered to a younger audience or someone not familiar with this field. I am missing the specifics as I am deep-diving into this for a learning module I am creating in another class. It would need significant revision it is so basic and obvious the answer. **For example:**

7. It is acceptable to interrupt participants if they are talking too much.

- **Answer:** False

Revised Prompt: “You are an experienced lead UX designer at your tech company. You are required to create a quiz for the devs that you work with to take after their training on soft skills, communication, and empathy. They are learning how to apply these skills with their users as they interview them on the features they coded and receive user feedback well. You need to include scenarios, specific features and responses from users and the ways to respond. Give some free-response questions to list what they learned from their training and how they plan to apply it. Create 8 questions on this quiz with a calm tone.”

Compare and Reflect:

Wow! It was a completely different output, felt like it was on a totally different subject, the way it went into depth, and exactly how I expected once I told it exactly what I wanted. I think the fact that I gave it a role of expertise and gave it the audience and scenario It knew what kind of quality and subject I wanted the questions on. Giving it specifics on the structure, length and question type gave it the format I wanted. I had to contribute the exact scenario and essentially provide what to be taught and how.

Task 2: Write a rubric for a project or performance-based assessment

First prompt: “Write a rubric for a UXUI project working through feature building and user testing for a website”

What worked and what didn't:

It was alright, and guessed the correct structure and similar points. It wasn't super specific in its descriptions, which could have a teacher struggling to know what points to give. It just wasn't what I imagined, necessarily. It would need significant revision.

This time I couldn't think of a super specific situation so I used a different Ai to help me write a better prompt with audience, format, and specific criteria to check.

Revised Prompt: "You are an expert UX/UI Design Educator. Write a comprehensive grading rubric for an upper-level undergraduate UX/UI project focused on feature building and user testing for a website.

Format & Constraints:

* **Structure:** A Markdown table totaling **100 points**.

* **4 Performance Tiers:** Excellent (100%), Proficient (85%), Developing (70%), and Unsatisfactory (50%).

* **Requirement:** Provide highly specific, behavioral descriptions for each tier. Avoid generic text like "Exceeded expectations."

Criteria Breakdown (20 Points Each):

1. **Feature Strategy & Ideation:** Problem definition, alignment of the feature with user needs, and MVP scope definition based on research.
2. **UX Architecture:** Quality of user/task flows, wireframes, and how seamlessly the new feature integrates into the existing website's navigation.
3. **UI Design & Prototyping:** Technical execution of the interactive prototype, visual hierarchy, typography, system consistency, and WCAG accessibility compliance.
4. **User Testing Execution:** Quality of the usability test plan (objectives, non-leading script) and execution of testing with actual users.
5. **Synthesis & Iteration:** Data analysis (e.g., affinity mapping) and clear "Before vs. After" design changes driven directly by user feedback.

Please generate the complete, detailed rubric table now."

Compare and Reflect:

This time it was super specific with criteria explanations. It avoided lazy, generic text like we asked it too, instead giving specific UX industry terms. It had more focus in non-biased

testing with users. Its math and logic were great. I do wish it wasn't so complex-looking. I think I like the easier navigation of the first, so maybe we would need another prompt to find the happy medium that is specific but not lengthy, creating cognitive overload.

Task 3: Suggest engaging learning activities for a specific topic and audience

First prompt: "Create engaging learning activities for kids in the basic learning categories."

What worked and what didn't:

It did do better than expected as it stated precise skills like vocabulary, letter recognition, critical thinking, speech, storytelling, sorting etc. I expected it to say like math, art, science, super basic subjects. But it doesn't fit my audience even though I told it kids, since the basic task 3 mentions an audience. My specific audience in mind was 2-4 year olds who are still very young and the starting skills that can be built off activities for moms to adapt into their routine. It has general ideas, make a snack, and more detailed ideas like "**Counting Nature Walk** – Collect leaves, rocks, or flowers and count, sort, and compare them by size or color." I think I could actually use some of these in this situation but I think the detailed prompt will get more of what I want.

Revised Prompt: "You are a loving mom who has time and is passionate about teaching her kids a lot of skills at a young age. You have a 2 year old and a 4 year old. You want to create opportunities for them to learn and be creative and grow at home daily and develop those skills early. Give engaging learning activities that are not typical or common in school and give your kids the upper hand on learning and creativity at home. Give the specifics of how psychology supports each skill and will support the child. Give detailed instructions on how to perform the activities. Deliver them in a loving, kind tone."

Compare and Reflect:

This time It got into detail and gave me ideas backed up by research and gave clear instructions on how to accomplish each activity. It started with credibility stating, "Researchers such as Jean Piaget emphasized that children construct knowledge by experimenting with their environment. When adults ask thoughtful questions instead of providing answers, children practice flexible thinking and persistence." I loved that it gave specific statements to say to your kids to let them accomplish themselves and celebrate

their attempts. I plan to mention all of those metrics in my future prompts as they can perform so much better and even missing a few will prevent you from receiving exactly what you want. I would absolutely use this as a mom and I'm sure I do research and planning like this with AI for my own kids one day.

I hope you are happy with how I structured this assignment I was a little confused on how the instructions stated it. This made sense to me and felt organized.

Here is the link to my chat, all 6 prompts I gave it in ChatGPT:
