Project 1 Assignment 2: Task Analysis & Outline

### **ALTA how-to Guide**

My software how-to guide is focused on the goal of adding an outfit to your digital closet. This is relatively complex as it first involves adding items to your closet, categorizing them, and then creating an outfit with them.

An additional goal that can be performed after the closet is added is scheduling outfits for the week.

A main persona type of my target audience is a busy student with no time for outfit planning due to the crazy school and work life.

I decided to do a contextual Inquiry on my husband, who fits the persona type. He is never able to plan his outfits and has never used the app. A great situation for me to observe how he interacts with the app, as well as interview him.

### **Notes**

He said it was good to start simple, but the only thing considered a 'how-to guide' the app had was a graphic explaining how it takes your photos and puts them in your closet and prompt you to add photos. There is a lot more to the app that is not explained and must be figured out by exploring yourself. Users may not know what they are looking at or what the app truly offers.

I noticed he had to click around and mess with things to figure out how it worked.

When asked how we would like to be shown the app, he suggested

He noted that he didn't know the calendar feature of the app existed until he stumbled upon it and that could help grab the attention of the user if they knew about it and how to use it in the first place.

The Ai avatar was another feature he found and thought was super cool but hidden and users could go a long time without even knowing about the feature and the benefit it

brings to their experience to visually see how they would look in their planned outfits.

These notes have led me to the decision to create my how-to as a demo. The reason for this is the actual tools and steps of the app are intuitive and simple if explained and the most important part is the buy-in of letting the user know what the app has to offer and how to find those features. If it can inspire them and excite them while also explaining how to use it there will be better success for the users and the app.

### **My how-to guide:**

I plan to state the steps while showing someone using the app in the same way, displaying the amazing experience they get. It will show someone following the exact steps of my HTA diagram (shown below) and show visuals as it does so. It will show the physical tasks such as setting out the clothes, the path of selected buttons to process them, and the AI that assists them.

AI use: I did not use any AI on this assignment.
